

Sentrais Core Build Standards

to make every experience feel like an **ERP/CRM for operations**: modular cards, linked workflows, role-based permissions, and intuitive navigation. These standards are meant to be **universal across EVERGAME, eVenu, CiviGrid, and future ventures**, so teams can learn once and operate anywhere.

1) Product Architecture Standard

A. “System-of-Record to System-of-Action” pattern

Every Sentrais build must support three layers, in this order:

1. **Records (CRM/ERP objects)**: the “what”
Examples: Venues, Events, Work Orders, Incidents, Vendors, Agencies, Assets, Credentials.
2. **Work (workflows)**: the “how”
Examples: readiness checks, approvals, escalations, SLA-driven resolution, after-action reviews.
3. **Intelligence (insights + automation)**: the “so what”
Examples: anomaly detection, risk scoring, predictive maintenance, staffing optimization.

Rule: No feature ships unless it clearly lands in one of these layers and links to the others.

B. Modular “Products as Workspaces”

- A **Workspace** is a vertical experience (EVERGAME Ops, eVenu VenueOps, CiviGrid Command).
- Workspaces share the **same** foundation: cards, records, workflows, permissions, reporting.

Rule: Shared patterns first. Vertical specialization only via configuration, not reinvention.

2) Navigation Standard

A. Sentrais “Three-Zone” navigation

Every build uses a consistent structure:

1. **Top Bar (Global):** Search, Create, Notifications, Help, Profile
2. **Left Rail (Workspace):** Modules (Ops, Incidents, Assets, People, Reports)
3. **Main Canvas:** Dashboard, Lists, Record Views, Workflow screens

B. One canonical user journey

- **Dashboard → List → Record → Workflow → Evidence/Output**
- A user should never get “lost” in a dead-end screen.

Rule: Every screen must answer: “What’s next?” via visible actions.

3) Card System Standard

Cards are your “ERP tiles” that make complexity scannable.

A. Card types (mandatory set)

1. **KPI Card:** metric + trend + target
2. **Status Card:** readiness, health, compliance state
3. **Task Card:** assigned action + due date + SLA
4. **Incident Card:** severity + owner + clock + escalation
5. **Asset Card:** condition + last service + predicted risk
6. **Workflow Card:** step-by-step progress and blockers
7. **Insight Card:** anomaly, recommendation, what changed
8. **Evidence Card:** proof, attachments, audit trail

B. Card anatomy (non-negotiable)

- Title
- Primary status (color + label)
- Owner/Team
- Time indicator (due, SLA, last updated)
- Primary action (one)
- Secondary actions (overflow)

Rule: A card must be actionable in under 5 seconds.

4) Records and Objects Standard

A. Every Record must have these sections

1. **Header:** name, status, owner, timeframe, key identifiers
2. **Summary:** what matters now (auto-generated or curated)
3. **Workflow:** current stage, next step, blockers
4. **Linked Items:** tasks, incidents, assets, vendors, agencies
5. **Evidence Ledger:** decisions, approvals, attachments, logs
6. **Timeline:** a chronological view of changes and actions

B. Relationship-first design

Records must feel connected like an ERP:

- Event ↔ Venue ↔ Assets ↔ Work Orders ↔ Incidents ↔ Agencies/Vendors

Rule: If a record cannot be meaningfully linked, it is not a first-class object.

5) Workflow Standard

A. Workflow design rules

- **Stage-based** with clear entry/exit
- **Role-bound** actions (who can do what)
- **Time-bound** with SLAs and escalation paths
- **Evidence-bound** (proof required where it matters)

B. Workflow primitives (must exist in every workflow engine)

- Assign
- Approve/Reject
- Escalate
- Comment/Collaborate
- Attach evidence
- Mark complete
- Reopen/Override with reason

Rule: Every workflow step must have a clear “definition of done.”

6) Permissions and Security Standard

A. RBAC + Contextual permissions

Use **role-based access control** plus context like:

- Workspace access (which product)
- Record access (which venue/event/agency)
- Field-level access (sensitive data)
- Action permissions (approve, escalate, export)

B. Permission tiers (recommended baseline)

- Viewer
- Contributor
- Operator
- Manager
- Admin
- Auditor

Rule: “Least privilege” by default. Elevation is explicit and logged.

7) Data and Status Standard

A. One status language across the platform

Avoid bespoke statuses in every module. Use canonical sets:

- **Operational status:** Not started, In progress, Blocked, Complete
- **Risk status:** Low, Medium, High, Critical
- **Compliance status:** Compliant, At risk, Non-compliant, Exception granted
- **System health:** Normal, Degraded, Outage (if needed)

B. Time is a first-class dimension

Every record must carry:

- Effective date window
- Last updated
- SLA timers where relevant
- Audit timestamps

Rule: Sentrais is temporal. Users should understand “when” instantly.

8) Interaction and UX Standard

A. Core UX principles (Sentrais brand behavior)

- Calm in chaos: minimal clutter, clear hierarchy, decisive actions
- Progressive disclosure: advanced detail appears only when needed
- Zero ambiguity: statuses and next steps are explicit
- No surprise navigation: predictable patterns everywhere

B. Standard interactions

- Global search with filters (people, events, assets, incidents)
 - Universal “Create” button (creates the right thing based on module context)
 - Inline editing for safe fields
 - Confirmation + rationale required for high-impact actions (override, close critical incident)
-

9) Reporting and Insights Standard

A. Every workspace ships with three report modes

1. **Executive view:** KPIs, risks, readiness, trends
2. **Operational view:** queues, workload, SLA adherence
3. **Audit view:** evidence completeness, exceptions, approvals

B. Insight governance

Insights must show:

- What the system observed
- Why it matters
- Suggested action
- Confidence indicator (where applicable)
- Link to evidence

Rule: Insights do not replace accountability. They accelerate it.

10) Build Quality Standard

A. Definition of “deployment-ready” (minimum bar)

- Responsive: desktop + tablet + mobile (mobile-first for field ops)
- Accessibility baseline (contrast, focus states, keyboard nav)
- Load behavior designed (skeletons, empty states, error states)
- Observability hooks (events, audit logs, performance)
- Help patterns: tooltips, inline guidance, “what’s next”

B. Component governance

- Single component library
- Tokens-driven (color, spacing, typography)
- No one-off components without design review

Rule: Every new component is either reusable or rejected.

Sentrais “Golden Path” Blueprint for Any New Module

Use this as the repeatable checklist for every build:

1. Define the **Record** (object + relationships)
 2. Define the **Card(s)** that represent it in dashboards and lists
 3. Define the **Workflow** stages and actions
 4. Define **Permissions** by role and context
 5. Define **Statuses** using canonical sets
 6. Define **Evidence** requirements and audit trail
 7. Define **Reports** (exec, ops, audit)
 8. Validate **navigation**: Dashboard → List → Record → Workflow → Output
-

If you want, I can translate these into a **Sentrais Design System spec** that your engineers can implement directly (component list, required props, states, and naming conventions), plus a **“starter workspace” template** for eVenu, EVERGAME, and CiviGrid.
