

Sentraais | NFL Security Architecture Summary

Purpose

This document provides a concise overview of the security and hosting architecture supporting the NFL Innovation Hub and related readiness initiatives delivered by Sentraais. It is designed to confirm security posture, ownership boundaries, and integration principles without exposing proprietary system internals.

Hosting and Tenant Ownership Model

NFL-Owned GCP Tenant

- Hosts the NFL Innovation Hub user interface and simulator experience
- NFL retains full control of identity, access management, logging, and encryption keys
- Supports NFL-defined user roles and partner access policies

Sentraais-Managed GCP Environment

- Hosts operational readiness execution, orchestration, and certification services
- Managed and secured by Sentraais under enterprise-grade GCP controls
- No shared credentials, infrastructure, or administrative access

Security Controls

- Encrypted data in transit and at rest
- Role-based access with least-privilege enforcement
- Full audit logging and monitoring
- Secure service-to-service authentication
- Environment isolation by tenant and workload

Integration Approach

- API-based integration between NFL and Sentraais environments
- Clearly defined data contracts and schemas
- No direct database, file system, or infrastructure access across tenants
- All processing of NFL data occurs within approved execution boundaries

Data Ownership and Protection

- NFL retains ownership of its operational and event data
- Sentraais processes data solely to deliver contracted outcomes
- Proprietary orchestration logic, scoring models, and system designs remain protected

Summary

This architecture provides a secure, auditable, and scalable foundation for the NFL Innovation Hub while preserving strict separation of ownership and responsibility. It enables rapid delivery, minimizes operational risk, and supports long-term collaboration.
