

SEAR-2 → SEAR-1 Escalation Logic

Sentrais Unified Operations OS

1. SEAR LEVEL DEFINITIONS (Baseline)

SEAR-2 (Elevated / Regional Coordination)

- State or regional lead
- Federal agencies in advisory or liaison role
- Elevated but manageable risk
- Planned events or credible watch conditions
- Evidence required, not immutable
- Escalation discretionary

SEAR-1 (National / NSSE-Equivalent)

- Federal lead (USSS / DHS / DOJ)
- Unified Command required
- National security implications
- Credible or active threat
- Immutable evidence and decision logging
- Escalation mandatory

2. ESCALATION PHILOSOPHY (Sentrais Principle)

Escalation is triggered by risk convergence, not a single event.

Sentraix escalates based on signal accumulation across four vectors, not panic indicators.

3. THE FOUR ESCALATION VECTORS

Escalation logic continuously evaluates four vectors in parallel:

Vector A – Threat Intelligence

Vector B – Operational Degradation

Vector C – Jurisdictional Complexity

Vector D – Time Compression

SEAR-1 is triggered when two or more vectors breach threshold, or one vector breaches a hard stop.

4. VECTOR A: THREAT INTELLIGENCE (HARD STOPS)

Automatic SEAR-1 Triggers

Any of the following immediately escalates to SEAR-1:

Credible threat validated by federal agency

Targeted threat against a protected person or site

Coordinated or networked threat indicators

Cross-border or international threat vector

Cyber intrusion affecting critical systems

Result

Federal Command assumes lead

Intelligence confidence levels activated

Decision log becomes mandatory

5. VECTOR B: OPERATIONAL DEGRADATION

Escalation Conditions

Escalate when two or more occur simultaneously:

Loss of primary communications

Failure of redundant systems

Inability to execute critical milestones

Sustained incident backlog

Incomplete or missing evidence at critical gates

SEAR-2 Behavior

State / City attempts mitigation

SEAR-1 Escalation

Federal systems and redundancy invoked

Operational periods shortened

Command authority elevated

6. VECTOR C: JURISDICTIONAL COMPLEXITY

Escalation Conditions

Escalate when any of the following are true:

Incident spans multiple cities or states

Authority conflict between agencies

Private infrastructure impacts public safety

Cross-agency dependencies stall response

Mutual aid exceeds regional capacity

Result

Unified Command enforced

Jurisdiction selector defaults to Federal

Local autonomy preserved only for execution

7. VECTOR D: TIME COMPRESSION

Escalation Conditions

Escalate when:

Threat or incident occurs inside T-72 window

Multiple unresolved risks exist inside T-24

Decision windows shrink below safe thresholds

Operational tempo exceeds local staffing capacity

Result

Escalation thresholds compressed

Mandatory escalation review triggered

Federal readiness posture activated

8. ESCALATION DECISION MATRIX

Condition Action

1 Vector breached Remain SEAR-2, monitor

2 Vectors breached Escalation review required

3 Vectors breached Mandatory SEAR-1 escalation

Any hard stop Immediate SEAR-1

9. SENTRAIS MODE TRANSITION (SYSTEM BEHAVIOR)

What Changes When SEAR-1 Activates

Navigation

No change

Context Bar

SEAR level updates to SEAR-1

- Federal lead displayed
- Clearance indicator visible
- Authority
- Federal command supersedes
- Local views scoped but preserved
- Evidence
- Evidence ledger locks
- Chain of custody enforced
- Decisions
- Decision logging required
- Timestamp + authority attribution mandatory

10.ROLLBACK LOGIC (SEAR-1 → SEAR-2)

De-escalation requires explicit federal authorization and:

- Threat neutralized or downgraded
- Systems stabilized
- Jurisdictional clarity restored
- Evidence completeness confirmed
- Rollback is never automatic.

11.WHY THIS MODEL HOLDS UP

Matches DHS / USSS escalation doctrine

- Avoids over-escalation
- Prevents political whiplash
- Preserves operator trust
- Defensible in AARs, IG review, and Congressional inquiry

This is operational maturity, not just software logic.

12. OPTIONAL NEXT EXTENSIONS

If you want, I can next:

- Translate this into a Sentrais escalation rules JSON

- Create a visual escalation flow diagram (board-safe)

- Draft SEAR-2 → SEAR-1 briefing language for Governors

- Map escalation logic to World Cup 2026 match timelines
