

Target Architecture

A. NFLOS Core (the base model you build once)

NFLOS is the platform foundation that every challenge instance uses.

NFLOS Core Services

1. Identity + Access

- RBAC roles: NOVATE Admin, NFL Executive, NFL Reviewer (IT/Ops/Media/Commercial), Auditor, Observer
- SSO support later (Azure AD), local auth now if needed

2. Ecosystem Registry

- “NFL Draft Innovation Challenge 2026” as an Ecosystem
- Contains cohorts, stages, scoring rubrics, timelines, reviewer pools, artifacts, evidence policy

3. Policy Engine

- Action gating: what can be viewed, scored, approved, exported by role
- Evidence requirements per stage gate and override

4. Workflow Engine

- Stage gates, SLA timers, escalations, reminders
- Deterministic state machine (no ad hoc states)

5. Evidence Ledger

- Append-only audit trail of submissions, scores, decisions, overrides, approvals, exports

6. Notification Service

- Email templates, cadence, routing (vendor, reviewer, steering)

7. Artifact & Export Service

- One-click exports: stage gate report, vendor shortlist pack, full evidence export, scoring exports

8. Observability

- Audit logs, system logs, job logs, event logs

This is the “platform you never rewrite.”

B. Sentrais Innovation Engine (SEI) as the Challenge Domain Engine

SEI is where the challenge is actually orchestrated.

SEI Modules

1. Challenge Command Center

- Pipeline health, stage gate readiness, SLA breaches, reviewer completion, risk flags

2. Submission Record Shell

- Vendor profile, pitch assets, NIN mapping, evaluation workspace, evidence, timeline

3. Scoring & Review Workspace

- Role-specific rubrics (IT/Ops/Media/Commercial)
- Weighted scoring model + confidence + required rationale

4. Stage Gate Orchestration

- “Recommend → Approve → Advance/Decline”

- Manual override requires reason and evidence
- 5. Comparative Analysis
 - Side-by-side vendor comparison, ranking, thresholds, shortlist builder
- 6. Outcome Transition
 - Handoff to OnePass outcomes, pilot plan, POC harness checklist, contracting readiness

SEI is your repeatable “innovation operations system.”

C. Draft Innovation Experience Overlay (the “skin”)

This is configuration and content, not code.

Overlay Components

- Draft timeline and stage windows (Discovery → Validation → War Room → Draft Week)
 - NFL terminology, banners, and labels
 - Default playbooks for each stage (demo scheduling, security review, POC harness, exec briefing)
 - Default success metrics and reporting pack
-

Scenario 1: Pitchtape Intake, Sentrais Client Experience

1) Interaction Model

Pitchtape

- Applicant-facing submission wizard
- Video capture, deck upload, applicant status view
- Transitional only

Sentrais

- All NFL stakeholder experience
- Evaluation, scoring, orchestration, evidence, artifacts, dashboards, exports

2) Data Flow (clean and defensible)

1. Applicant submits in Pitchtape
2. Pitchtape sends webhook to Sentrais Ingestion API
3. Sentrais creates:
 - Ecosystem → Challenge instance → Submission record
 - Evidence stub entries (video, deck, form fields)
 - Default NIN phase mapping (P1 at intake)
4. Sentrais assigns reviewers automatically (category-based rules)
5. Reviewers score in Sentrais
6. Sentrais computes composite and triggers stage gate recommendation
7. NFL approves in Sentrais
8. Sentrais updates Pitchtape status (so applicant sees progress)
9. All decisions and transitions logged in Evidence Ledger

This preserves the principle: one system of record for governance.

The key decision you need to lock

You wrote: “All in SEI, except reviewer scoring, audit and tracking dashboard...”

My recommendation: do not split scoring/audit away from Sentrais.

Why:

- Scoring and audit are the highest-risk surfaces.
- If scoring lives elsewhere, you lose deterministic governance, and disputes become harder to defend.

If NFL wants their own view, do one of these instead:

- Embedded dashboard (iframe/embedded views) sourced from Sentrais
- Read-only replica (exported dataset to NFL BI) with Evidence Ledger hashes and stage gate snapshots

That keeps Sentrais as the authority while accommodating NFL preferences.

Build Sequence (so the team can execute fast)

Phase 0: Standing up NFLOS (foundation)

- Create Ecosystem Registry + RBAC + Policy + Workflow + Evidence + Export scaffolding
- Define canonical objects: Ecosystem, Challenge, Submission, ReviewerAssignment, Scorecard, StageGateDecision, EvidenceItem, Artifact

Phase 1: SEI Challenge Engine (repeatable engine)

- Command Center dashboard
- Submission record shell
- Scoring workspace + rubric builder
- Stage gate workflow + report generator
- Comparative analysis view

Phase 2: Pitchtape integration (transitional)

- Ingestion endpoint + webhook validation
- Asset references and evidence stubs
- Status sync back to Pitchtape
- Fallback intake path (CSV/email ingestion)

Phase 3: Draft overlay (configuration)

- Load Draft timelines, default playbooks, language pack, KPI targets
- Seed data (sample vendors, reviewers, stages) for demo and UAT
