

eVenu360 is a 360 Operational Visibility, Event Certification, and Readiness Runtime.

1) Canonical Product Definition

eVenu360 is a 360 Operational Visibility, Event Certification, and Readiness Runtime.

It provides a single operational command layer per event that orchestrates:

1. **Readiness and Compliance** (pre-event certification and preparedness)
2. **Live Operations** (event-day execution, incident readiness, and comms)
3. **Resilience Response** (escalation pathways, coordinated response, evidence capture)
4. **After-Action Learning** (AAR, performance scoring, renewal readiness)

This maps directly to your Resilience Orchestration cycle:

Readiness → Run → Response → Review → Renewal.

2) The Event Master Model (This Is the Backbone)

To make this platform “rinse and repeat,” every experience must be an instantiation of the same **Event Master**.

Event Master (Record)

- Event Name
- Venue(s)
- Ecosystem (program container)
- Start/End dates
- **Temporal windows**
 - Pre-Event window (T-180 to T-1)

- Event-Day window (T0)
- Post-Event window (T+1 to T+90)
- Owners (Ops, Compliance, Safety)
- Certification target(s)
- Playbook set applied (blueprint)

Temporal Mode Switcher

This is not UI sugar. It is the operating system selector:

- Determines which workflows are active
 - Determines which evidence is required now
 - Determines which dashboards emphasize what matters
-

3) Standard Navigation and Surface Architecture

You already have the correct top-level design. Here's the standardized interpretation.

Global Navigation

Sidebar

- Role Switcher (Executive / Operator / Auditor)
- Modules:
 - 360 Overview
 - Command Center
 - Compliance & Evidence
 - Playbooks

- Calendar
- Learning (AAR)

Event Banner

- Event selector (Event Master)
 - Temporal mode switcher (Pre-Event / Event-Day / Post-Event)
 - Status chips: Readiness, Certification, Risk, Evidence posture
-

4) The Three Role Dashboards (Standardized)

A) Executive Dashboard

Purpose: Board/Commissioner/Mayor view. Outcomes, posture, risk.

Required sections

- Readiness Scorecard (overall + category)
- Certification Posture Banner
- Risk Alerts (top 3)
- Evidence Completeness (percent + blockers)
- Timeline: “what changed”
- “Next decisions” panel

No operational clutter. Executive does not see queues unless toggled.

B) Operator Dashboard

Purpose: Command runtime.

Required sections

- Live zone status (venue zones, workstreams, or agencies)
- Active playbooks (now-running only)
- Task checklist + SLA timers
- Incident log + escalation clock
- Team communications panel (stub if comms not live)
- “Next actions” stack

Operator should always feel: **Run the playbook.**

C) Auditor Dashboard

Purpose: Defensibility and compliance.

Required sections

- Compliance checklist by category
- Evidence library (missing/expired/invalid filters)
- Audit trail (approvals, overrides, lineage)
- IDS compliance banner + explain
- Export readiness

Auditor view should always answer: **Can we defend this?**

5) The Playbook System (Four Types)

This is the piece that turns the product from a dashboard into a system.

Four Playbook Types (Standard)

1. Readiness Playbook

- T-180 to T-1
- Certification prerequisites
- Inspections, rehearsals, vendor readiness

2. Event-Day Ops Playbook

- T0 runtime execution
- Checkpoints, comms, incident readiness

3. Resilience Response Playbook

- Triggered by severity thresholds
- Escalation + coordination actions

4. After-Action Learning Playbook

- T+1 to T+90
- AAR capture, performance scoring, renewal actions

Required Playbook Mechanics

- Step-by-step workflow stages
 - Progress tracking (percent + stage)
 - Evidence attachment points at critical steps
 - Role-gated actions (approve, escalate, override)
 - Temporal activation rules (which steps appear when)
-

6) The 360 Operating Cycles (Your “Operations, Performance, Certification, Learning”)

This is how you frame the platform consistently across verticals.

1) Operations

- Run-of-show, tasks, incidents, comms

2) Performance

- SLAs, readiness trends, bottlenecks, staffing and throughput signals

3) Certification

- Evidence sufficiency, exceptions, export readiness, renewal posture

4) Learning

- After-action insights, recommendations, policy updates, playbook refinement

These become:

- Four tabs inside Executive and Auditor
 - Four panels inside Intelligence
-

7) What You Need Next to Make This “Reusable and Fast”

You already built the surfaces. The next unlock is **standardizing the blueprint application + calendar**.

A) Event Master Calendar

A master schedule that shows:

- All events in the ecosystem
- Each event's temporal posture (pre/event/post)
- Readiness and certification status per event
- Drill-down into any event's 360

B) Blueprint Application

A “template seed” that can be applied to an event:

- selects playbook set
- loads default tasks
- loads evidence requirements
- loads certification categories
- sets temporal offsets

This is the “rapid onboarding switch” when a POC closes.

8) How to Message It (One-Line + Wow Line)

If you need the clean framing:

One-line

“eVenu360 is an event certification and readiness runtime that gives leaders 360 operational visibility before, during, and after high-stakes events.”

Wow line

“It’s not a dashboard. It’s a temporal operating system that runs the playbook, proves compliance, and converts learning into renewal.”

9) What I'll Generate Next (So You Can Deploy in Lovable Fast)

To operationalize exactly what you just described, I'll produce two things next:

1. **Lovable build prompt for Event Master Calendar + Blueprint Apply flow**
2. **Lovable deployment template that seeds SOFI + Mercedes with the four playbook types and temporal rules**

Before I write the prompts: I'm going to assume the four playbook types are named:

- Readiness
- Event-Day Ops
- Resilience Response
- After-Action Learning
